

## Cushion Tire Forklift Part

Cushion Tire Forklift Parts - Cushion tires have a smooth profile on a firm tire with its tread being cemented to a steel ring so as to shape the tire. The tire is pressed on the hub which is then attached onto the lift truck. These tires are ideal to utilize in smooth floor warehouses and are obtainable in several rubber or polyurethane compounds.

A poly tire has polyurethane as a replacement for rubber and is likewise a solid tire. They are used rather than cushion tires for such applications that need a lower steering effort or a higher tire load capacity than could be attained with the cushion tire. Poly tires are in several hardness ratings in order to meet various particular application needs. Orderpicker lift trucks and Narrow Aisle models would usually make use of small diameter poly tires for their outrigger load wheels.
